運動數據與球員新

報告者:資工系113級洪盛益

2

問題(Question)

- 球員薪資與戰績是否有關係?
- **E**戰績的相關性? 員薪資與特 松
- 球員薪資與數據實際上的意義是否吻合?

資料集(Data)

• 球員薪資表:

https://www.usatoday.com/sports/mlb/salaries 格式:html plaintext->python dictionary->txt

財員の表記

恪式:mircrosoft xlxc->pandas dataframe->txt https://www.smartfantasybaseball.com/tools

3.2

資料集(Data)

• 球員數據:

格式:html plaintext->python dictionary->txt https://www.mlb.com

置作(Implementation)

電電

```
salary=int(i.find(class ="salary").text.strip().repl
                                                                                                                                                                                                                                                                                                                                                                                                       name=i.find(class_="sp-details-open").text.strip()
                                                                                                                                                                                                                        url="https://www.usatoday.com/sports/mlb/salaries/"
                                                                                                                                                                                                                                                                                        table=content.find all("tr")[1:num+1]
                                                                        soup=bs4 (response.text,"lxml")
                                                                                                                                                                                                                                                        content=getContent(url)
                                  response=rq.get(url)
getContent(url):
                                                                                                                                                                                      def getSalary(num):
                                                                                                                                                                                                                                                                                                                                                                       for i in table:
                                                                                                                                                                                                                                                                                                                                   {	t resultLIST} = [\ ]
                                                                                                               return soup
```

resultLIST.append({"Name":name,"Salary":salary})

return resultLIST

置作(Implementation)

寫檔(WriteFile)

```
as
F:
                with open (path, "r")
                                  result=f.read()
readtxt (path):
                                                       return result
```

讀檔(ReadFile)

```
f.write(json.dumps(i)+"<my cutting tag>")
                               with open ('output.txt', "w", newline='\n') as f:
                                                                  for i in playerLIST:
def writetxt(playerLIST):
```

實作(Implementation)

把字串轉成列表

```
plaintext=txt.split("<my_cutting_tag>")[:-1]
                                                                                                             resultLIST.append(eval(i))
                                                                                  for i in plaintext:
txt_to_list(txt):
                                                                                                                                        return resultiisT
                                                        resultLIST=[]
```

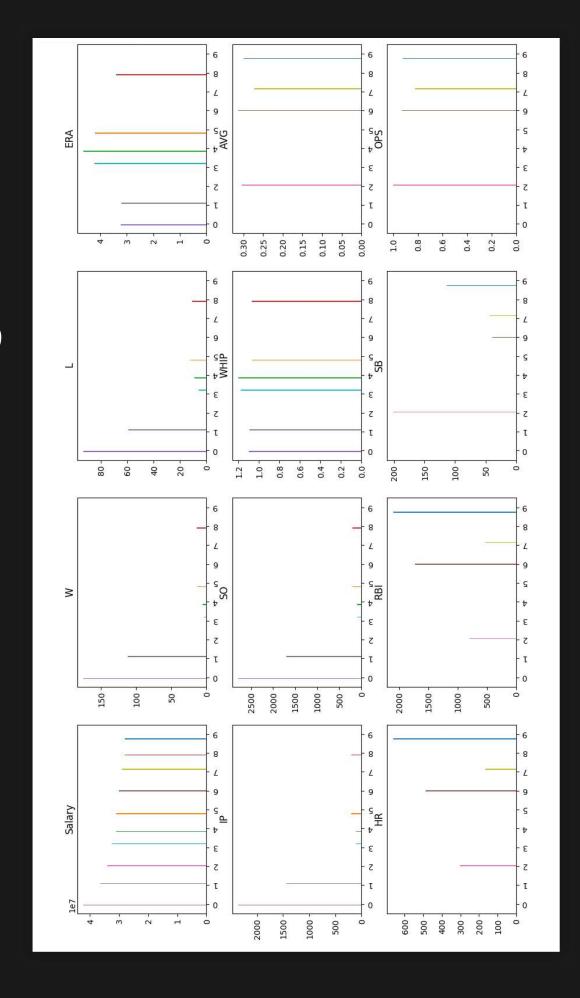

主函式

```
playerDF=pd.DataFrame(playerLIST)
                      txt=readtxt ("./output.txt")
                                              playerLIST=txt to list(txt)
main ":
                                                                                                                          makePlot(playerDF)
                                                                                                 print (playerDF)
   name
```

實作(Implementation)

事未 存

```
DF.pivot(values=i,columns='Name').plot(kind='bar',ax=
                                                                                                                                        fig, axes = plt.subplots(nrows=(len(col)//4 if len(col)%
                                                                                                      labels=DF["Name"].values.tolist()
                                                                  col=DF.columns[1:]
                                                                                                                                                                                                                                                                                        fig.legend(labels)
def makePlot(DF):
                                                                                                                                                                                                                                                                                                                         plt.show()
```

結果分析(Analysis)

球員薪資與戰績是否有關係?

數據與部分戰績有有關係 根據圖表顯示,

球員薪資與特定戰績的相關性?

正相關:W,L,IP,SO

負相關:HR,RBI

凸起:ERA,WHIP

看不出來:AVG,OPS,SB

結果分析(Analysis)

球員薪資與數據實際上的意義是否吻合? 勝場敗場:經驗

IP:投球局數,同上,經驗。

KBI:打點,送了多少位球員回本壘。

ERA:防禦率,越低越好。
